High rates of maternal smoking in pregnancy and childhood obesity in infancy are both risk factors for later obesity in childhood. The goal of this study is to examine the independent and interactive effects of maternal smoking during pregnancy and infant feeding on adiposity and fat distribution in childhood. An additional goal is to examine whether associations between the feeding practices and body composition differ by ethnicity. The proposed study is a secondary analysis of data collected on 2,112 mothers and their children from birth to age 6, with focus on 1,534 (20% African American and 80% Caucasian) children whose mothers were interviewed in early pregnancy (average gestation = 14 weeks) and whose offspring were tested at age 6 (average age = 2.5 years). Associations between maternal smoking and infant feeding during the first 6 months and adiposity and fat distribution at age 6 will be examined in models controlling for potential confounders, including maternal and paternal smoking, socioeconomic status, and gest 4bc0debe42
